

P16 - FROM THE STROCK-250 TO THE SERRURIER: WHAT'S NEW FOR THE VEGATRON PROJECT

Paul Pointier

Since we have got our mirror through our collaboration with the French Astronomical Society, our telescope has evolved significantly. We replaced the structure type Strock 250 with a Serrurier structure. This new architecture greatly reduces the bending gap between the two mirrors which keep the optical axis straight. Currently, construction has progressed very well, as more than half of the telescope has been completed. The final steps involve finishing the structure and beginning the collimation process.
